

ABSTRACT OF THE DISCLOSURE

Frame structure made of steel for wide opening sliding closure with vertical opening, of the type of door with covering panel/sheet out of alignment with respect to closing and movement means, in which, at least the lower tubular profile, internally, forms an area containing the carriages, positioned toward the side of the exterior closure, with an opposite and adjacent area that has the sideways extension of the profile with a projecting surface with respect to said sliding means, said surface being provided along the upper side with a glass buffer edge and with a base in correspondence with which the spline is applied; and furthermore in which the said lower profile cooperates with an analogous upper guide profile that holds the relative and opposite edge of the glass, an upper profile equipped with hinges, on the opposite side of application of the pane, a sliding block, acts against a vertical wall of said upper profile.
